The Cover Letter

To: **Reddit Inc.**
For the job role: **Senior Software Engineer, Crypto Security**

Hello,

I just found your job post on LinkedIn. I've using been using Solidity for the past two years working on some of the current tokens available in the market; ARTEQ and QLINDO. Throughout these years, I learned a lot about EVM internals and how security can be guaranteed for smart contracts. I have strong background in information and network security and have been part of a CERT center back in Iran.

I have also used various Solidity patterns like Proxy Pattern in order to make a big Solidity code modular and maintainable. My contracts have also gone through various auditing processes mainly by Certik. So, I'm familiar with the known issues when it comes to developing a secure smart contract.

In parallel, as a Senior Software Engineer, I do have strong hands-on C/C++, Golang, NodeJS, and Rust. As a cloud engineer, I have been dealing with Kubernetes deployments using AWS EKS technology. As a distributed systems architect, I have been actively working with architects and the product team in order to translate complex distributed problems into technical tasks.

I am also a book author. My latest book, Extreme C, is about the advanced usage of C language in modern software development.

I'm looking forward to hearing from you.

Best regards,
Kam
