Application for the Junior QA Engineer position in Vienna

Dear Hiring Team,

I am applying for the Junior QA Engineer position at LOYTEC. I live in Vienna, I am an EU citizen (Dutch), and for the past two years I have been a Software Test Engineer at DeKrypt BV, testing a trading and settlement platform in a Scrum team. The mix of manual testing against specifications, Python automation, and AI-supported test development in your posting matches how I work today, and building automation is a domain I would like to grow into.

At DeKrypt BV I executed manual test cases derived from the product specifications, designed new test cases together with the developers for each feature, and automated the integration and system tests in Python with pytest, running them in CI/CD pipelines on Linux. When a test failed I collected the service logs and the API responses to narrow the defect down before reporting it in Jira with clear reproduction steps. I also used Claude to draft test cases and speed up test-script writing, which is the kind of AI-supported work your posting describes.

I hold a bachelor's degree in IT Engineering and worked as a developer in C#/.NET and Java before moving into testing, so I am comfortable reading technical specifications and turning them into test cases. Embedded systems and protocol analysis with Wireshark are areas where my experience is still at the beginning, which is exactly why a junior role at a company that builds its own hardware and uses open protocols appeals to me. I am fluent in English and currently learning German, and I am preparing for the ISTQB Foundation Level exam.

I would welcome the opportunity to discuss the role. Thank you for considering my application.

Kind regards,
Afsaneh Sadeghnia
